

Setup Instruction Guide

System Requirements: Python 3.11+, Git, VS Code, and at least 8 GB RAM are recommended.

Step 1: Clone the repository from GitHub and navigate to the project folder.

Step 2: Create a virtual environment using Python venv.

Step 3: Activate the environment and install dependencies from requirements.txt.

Step 4: Execute the preprocessing pipeline to clean and encode the dataset.

Step 5: Train the machine learning model using the training script and verify model artifacts are generated successfully.

Step 6: Start the FastAPI backend server and confirm API endpoints are accessible through Swagger documentation.

Step 7: Launch the Streamlit application and access the dashboard through the browser.

Successful completion of these steps will provide a fully functional local deployment of the project.
